

Overall Status

ALARM

- 20.9% of funds are simultaneously showing outflows clearly below their own normal (alarm level 10.4%, normal-period average 4.4%).

Indicator	Level	Description
Breadth of fund outflows (TEFAS)	ALARM	Week of 25/09/2026: 20.9% (910 funds monitored)
FX shock (CBRT EVDS)	—	No data

1. BREADTH OF FUND OUTFLOWS

Shows what share of funds are, in the same week, experiencing outflows clearly below their own normal. The noise of a single fund does not distort this measure; a common market-wide move raises the breadth.

20.9%

Latest week (25/09/2026)

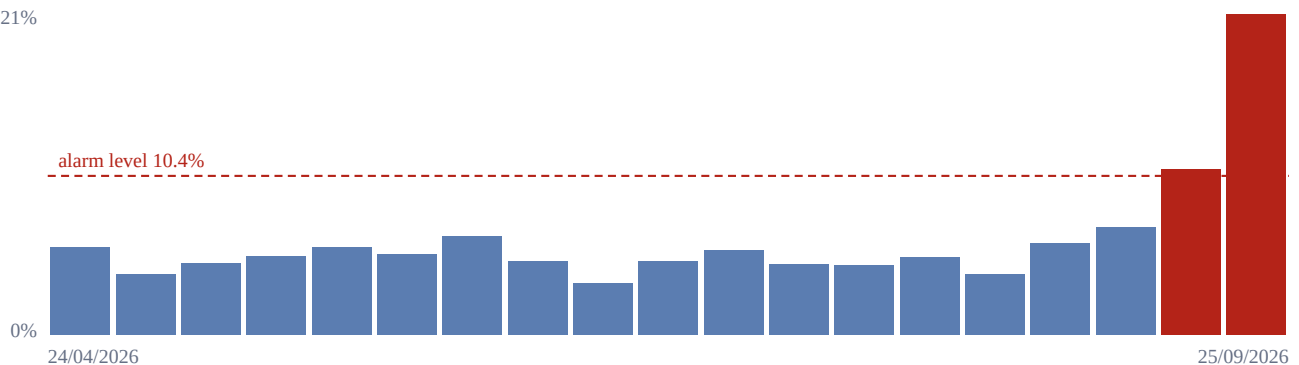

4.4%

Normal-period average

10.4%

Alarm level

21%

Red bars are the weeks that triggered an alarm. The watch level is 7.4% and above.

3. DATA COVERAGE

Source	Field	Observations	First	Last
No records				

4. POINTS TO CHECK

- Check the list of funds with the highest outflows and the movement in money market funds.
- Compare exchange-rate and interest-rate developments (CBRT announcements, KAP disclosures) on the same day.
- If the alarm persists, confirm it with the next week's data; a one-week alarm is not a conclusive result.

This list is not investment advice; it points to items to examine.

5. RELIABILITY AND LIMITS

Important: The models in this system have not been calibrated yet (M20: DEVELOPMENT, M21: DEVELOPMENT). The fund-outflow alarm has so far been tested on only one real event (September 2026), and the alarm came in the same week as the event; lead time has not been demonstrated. FX shock detection succeeds in 4 of 5 events but does not predict shocks in advance. No independent validation has been performed. Do not rely on this report alone for decisions.

6. METHOD

Topic	Description
Fund breadth	For each fund, the z-score of weekly net flow against its own median/MAD; the share of funds with $z \leq -3$. The alarm level is learned from the reference period (the largest of mean + 4σ , twice the mean, or +5 points). The watch level is mean + 2σ (an accepted threshold, not calibrated).
FX shock	The daily log return being ≥ 5 robust sigmas relative to the median/MAD of the previous 250 days and $\geq 2\%$. Only past data is used.
Data	TEFAS fund data, TCMB EVDS exchange rates. Observations carry a publication timestamp; later corrections do not change an earlier result.
